## WORK EXPERIENCE

### Pharaon group, Syria — *Software developer, full-time*

System analysis and problem solving plus new features development in Syria Sept 2021 -2022

**Like IPTV company.** teams up with the front end team -mobile and web- to create new application features such as ADS and version functionality for the mobile application. *Laravel restful APIs*

*Refactored an old version of an existing code plus developed a way to speed up the web application for the IPTV control panel by optimizing database queries. Mysql, laravel*

Uploaded current systems to gitlab, and make advantage of version control to smoothly separate the work between different developers

**Sawa isp.** Worked on the internet provider control panel's new features to robust the ISP productivity

## EDUCATION

### Damascus University, Bachelor in Software Engineering.

June 2016 - July 2022

## PROJECTS

**Multiple vendors project.** By leveraging the power of laravel MVC design pattern and extending it with DDD(domain driven design) pattern, this project has become easily maintained. -ongoing project on [github](#)

**Restaurant menu management project.** Built from the ground up, a restaurant menu management project that offers its clients a menu built with the application client's dishes, it provides an easy to use control panel

Clients can add their item of choice dishes, ingredients and a dish cost of a local currency

The dashboard asks the application clients for their restaurant infos, Lastly, provide a QR code that can be downloaded and printed in a table in their restaurants or could be published on social media, which provide a flexible way to publish clients menus

The application provides an easy way for a client's customer to scan his menu by easily scanning the QR using a mobile camera and get redirected to the client menu page to choose a set of dishes and juices (depends on the client's provided items), Next is to choose the count for each item selected in the cart or to discard other ones, lastly is to choose the type of order (delivery or a table) and confirming the order; that will send the order to client dashboard to proceed with it.

## STACK

**Proficient:** Php laravel framework, JavaScript, MySQL, Git.

**Familiar:**React.js, design patterns, pusher and websockets for laravel real time applications, pest for testing APIs, ubuntu and manjaro linux file system, event-sourcing and CQRS

## LANGUAGES

**Arabic** native

**English** intermediate
